## 1. Stud welding in refractory construction

### 1.1 Technical information

The weldings elements shown in this catalogue are designed for drawn arc stud welding. Some welding elements are also available as model for manual welding or with thread for screwing. In each case this is explicitly indicated.

#### **Flux (aluminium ball) and weld pool backing**

According to DIN EN ISO 13918 (Welding – Studs and ceramic ferrules for arc stud welding) welding elements for drawn arc stud welding standardly have a pressed-in aluminium ball at the welding tip. This serves as flux for improved ignition and stabilization of the electric arc as well as for deoxidising the weld pool.

(Exceptions: insulation pins (type ISMS, ISA, ISB), fiberfix (type FFS, FFD) and threaded studs (type DRS, M5 and M6) do not have a pressed-in aluminium ball at the welding tip. Rectangular studs (type A, B and C) standardly do not have a pressed-in aluminium ball, but can be produced with aluminium ball on demand.)

For weld pool backing standardly ceramic ferrules are used. Accordingly, suitable ceramic ferrules are included in every welding element shipment. A ceramic ferrule can only be used once; it is removed from the welding element after welding by striking at it.

As an alternative to ceramic ferrules shielding gas can be used for weld pool backing. In this case according to DIN EN ISO 13918 welding elements without pressed-in aluminium ball at the welding tip are used (see catalogue **Welding studs – Drawn arc stud welding with shielding gas**).

#### **Materials**

We produce our welding elements for refractory construction from the following materials:

Description		Max. application temperature (air)	Tensile strength (Rm)	Yield point (Rp0,2)
Material number	DIN/EN			
1.0116	Steel 4.8	-	≥ 420	≥ 340
1.4301	X5CrNi18-10	450-500° C	500-700	195
1.4541	X6CrNiTi18-10	450-500° C	500-730	200
1.4571	X6CrNiMoTi17-12-2	450-500° C	500-730	210
1.5415	16Mo3	530° C	440-570	265
1.4828	X14CrNiSi20-12	950-1000° C	500-750	230
1.4841	X15CrNiSi25-20	1100-1150° C	550-750	230

For welding elements from other materials please send us your inquiry or contact us.

On demand, the material properties can be verified by an inspection document (test report, inspection certificate) according to DIN EN 10204.

We are pleased to inform you about weldability to different base materials and welding parameters.

#### **Dimensions**

Welding elements dimensions are given in the measurement tables (all dimensions in mm). All standardised welding elements conform to DIN EN ISO 13918. Not standardised welding elements are supplied according to DIN EN ISO 13918. Special welding elements, which are not described, are delivered upon request.

Dimensions that are not listed in the measurement tables are delivered upon request.

For all welding elements for drawn arc stud welding the nominal length ( $l_1$  resp.  $l_2$ ) always corresponds to the length after welding. Depending on the diameter the length before welding ( $l_1$ ) is larger by a weld allowance of 1 to 5 mm.

(Exception: For boiler studs (type KS) the nominal length ( $l_1$ ) corresponds to the original length, i.e. the length before welding.)

For welding elements for manual welding the nominal length ( $l_1$  resp.  $l_2$ ) always corresponds to the original length, i.e. the length before welding.

### **Threads**

The threads of the welding elements are cold rolled acc. to DIN 13-1 (tolerance limit 6g). For surface-treated welding elements the tolerance limit 6h can be reached.

We deliver welding elements with special threads upon request.

### **Weld fillet**

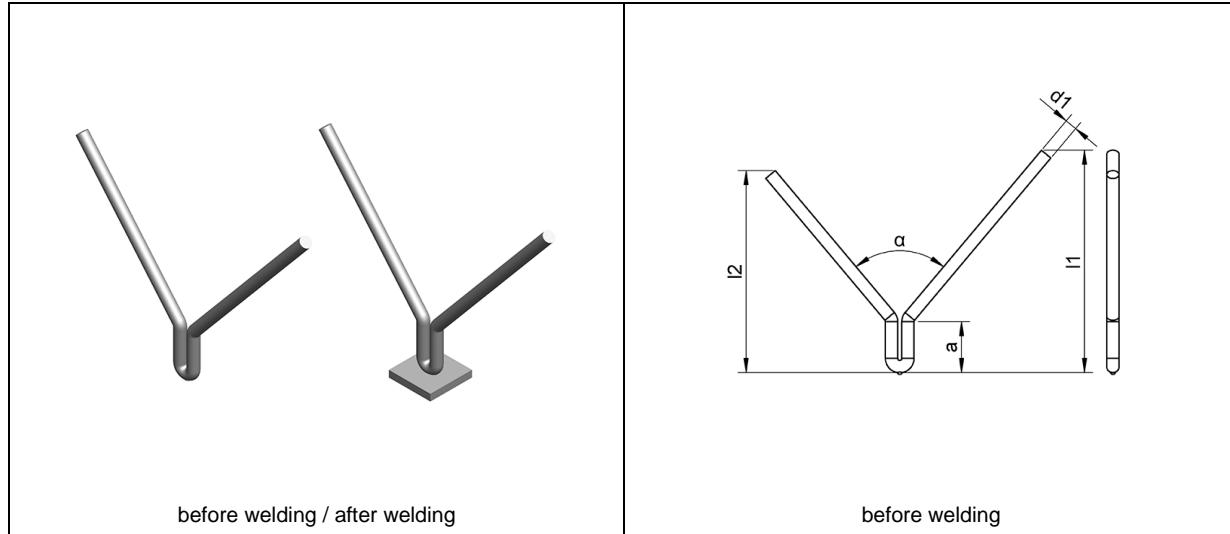

During drawn arc stud welding a fillet forms between welding element and base material. The dimensions of the weld fillet are defined by the used ceramic ferrule and the welding parameters. The diameter of the weld fillet is always bigger than the nominal diameter of the welding element.

### **Accessories for stud welding guns**

Accessories for stud welding guns (chuck, ferrule grip, foot piece etc.) have to be adjusted to the welding element. The accessories which are to be used for the individual welding element can be found in chapter 2.

## 1.10 Threaded stud, internally threaded stud, non-threaded stud acc. to DIN EN ISO 13918

### 1.10.1 Threaded stud with partial thread (type PD acc. to DIN EN ISO 13918)

The threaded stud type PD has a partial thread. The diameter of the unthreaded stud section on the welding tip corresponds to the pitch diameter of the thread. Thus the diameter of the weld-fillet is approximately 3-4 mm larger than the external diameter of the thread.
